Pre-Requisites

https://lcastrose.signin.aws.amazon.com/console

Create the Environment in AWS with the Ubuntu AMI (Ubuntu Server 18.04 LTS (HVM), SSD Volume Type) using 3 instances of T2.Medium:

- 1 Master & 2 Worker Nodes

Create all instances in a new subnet (according Lab Files), then you need to add the following components:

- VPC
- Internet Gateway
- Public IP address for each Instance
- Default Route
- Security Group allowing all incoming traffic from your subnet

Step 1 - Preparation

Change the hostname for every instance accordingly

sudo hostnamectl set-hostname kubernetes-master

sudo hostnamectl set-hostname worker-1

sudo hostnamectl set-hostname worker-2

```
root@ip-10-1-0-85:/home/ubuntu# hostnamectl set-hostname worker-2
root@ip-10-1-0-85:/home/ubuntu# vi /etc/hosts
```

Perform this task in all three instances

sudo vi /etc/hosts

<IP_Add_K8s_Master> kubernetes-master

<IP_Add_Woker-1> worker-1

<IP_Add_Woker-2> worker-2

```
127.0.0.1 localhost

# The following lines are desirable for IPv6 capable hosts
::1 ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
ff02::3 ip6-allhosts

10.1.0.12 worker-1
10.1.0.85 worker-2
10.1.0.109 kubernetes-master
```

Step 2 - Docker Install

sudo apt update

```
root@ip-10-1-0-85:/home/ubuntu# sudo apt update
Hit:1 http://us-east-1.ec2.archive.ubuntu.com/ubuntu bionic InRelease
Get:2 http://us-east-1.ec2.archive.ubuntu.com/ubuntu bionic-updates InRelease [88.7 kB]

The following NEW packages will be installed:
  conntrack cri-tools kubeadm kubectl kubelet kubernetes-cni socat
0 upgraded, 7 newly installed, 0 to remove and 73 not upgraded.
Need to get 52.0 MB of archives.
After this operation, 275 MB of additional disk space will be used.
Get:1 http://us-east-1.ec2.archive.ubuntu.com/ubuntu bionic/main amd64 conntrack amd64 1:1.4.4+snapshot20161117-6ubuntu2 [30.6 kB]
```

kubeadm version

```
root@kubernetes-master:/home/ubuntu# kubeadm version
kubeadm version: &version.Info{Major:"1", Minor:"18", GitVersion:"v1.18.1", GitCommit:"7879fc12a63337efff607952a323df90cdc7a335",
```

Step 5 - Initialize Cluster in Master ONLY

kubeadm init —pod-network-cidr=10.244.0.0/16

```
root@kubernetes-master:/home/ubuntu# sudo kubeadm init --pod-network-cidr=10.244.0.0/16
W0410 20:44:33.659228    6578 configset.go:202] WARNING: kubeadm cannot validate component configs for API groups [kubelet.config.k8s.io kubeproxy.config.k8s.io]
[init] Using Kubernetes version: v1.18.1
[preflight] Running pre-flight checks
        [WARNING IsDockerSystemdCheck]: detected "cgroupfs" as the Docker cgroup driver. The recommended driver is "systemd". Please follow the guide at https://kubernetes.io/docs/setup/cri/
[preflight] Pulling images required for setting up a Kubernetes cluster
[preflight] This might take a minute or two, depending on the speed of your internet connection
[preflight] You can also perform this action in beforehand using 'kubeadm config images pull'

[certs] Generating "etcd/server" certificate and key
[certs] etcd/server serving cert is signed for DNS names [kubernetes-master localhost] and IPs [10.1.0.109 127.0.0.1 ::1]
[certs] Generating "etcd/peer" certificate and key
[certs] etcd/peer serving cert is signed for DNS names [kubernetes-master localhost] and IPs [10.1.0.109 127.0.0.1 ::1]
[certs] Generating "etcd/healthcheck-client" certificate and key
[certs] Generating "apiserver-etcd-client" certificate and key
```

Save the output command to join worker nodes, as the follow example:

```
Your Kubernetes control-plane has initialized successfully!

To start using your cluster, you need to run the following as a regular user:

  mkdir -p $HOME/.kube
  sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
  sudo chown $(id -u):$(id -g) $HOME/.kube/config

You should now deploy a pod network to the cluster.
Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:
  https://kubernetes.io/docs/concepts/cluster-administration/addons/

Then you can join any number of worker nodes by running the following on each as root:

kubeadm join 10.1.0.109:6443 --token 0pkqzf.qdozh5j8yae2locm \
    --discovery-token-ca-cert-hash sha256:0d22dfcf6325143a034ce80ccb3b57b9c92a3c49e27f56b3702be3e77befeb7c
```

kubeadm join 10.1.0.109:6443 --token bk4qq9.x3irstlsbkn2o5i4 --discovery-token-ca-cert-hash sha256:0d22dfcf6325143a034ce80ccb3b57b9c92a3c49e27f56b3702be3e77befeb7c

mkdir -p $HOME/.kube

sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config

sudo chown $(id -u):$(id -g) $HOME/.kube/config

```
root@kubernetes-master:/home/ubuntu# mkdir -p $HOME/.kube
root@kubernetes-master:/home/ubuntu# sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
root@kubernetes-master:/home/ubuntu# sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

sudo kubectl apply -f https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml

```
root@kubernetes-master:/home/ubuntu# sudo kubectl apply -f https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml

kubernetes-master   Ready    master   3m13s   v1.18.1
```

Step 6 - Add the workers nodes to the cluster

kubeadm join 10.1.0.109:6443 --token bk4qq9.x3irstlsbkn2o5i4 --discovery-token-ca-cert-hash sha256:0d22dfcf6325143a034ce80ccb3b57b9c92a3c49e27f56b3702be3e77befeb7c

```
root@ip-10-1-0-85:/home/ubuntu# kubeadm join 10.1.0.109:6443 --token bk4qq9.x3irstlsbkn2o5i4     --discovery-token-ca-cert-hash sh
a256:0d22dfcf6325143a034ce80ccb3b57b9c92a3c49e27f56b3702be3e77befeb7c
W0410 21:19:56.091403   17168 join.go:346] [preflight] WARNING: JoinControlPane.controlPlane settings will be ignored when control
-plane flag is not set.
[preflight] Running pre-flight checks
        [WARNING IsDockerSystemdCheck]: detected "cgroupfs" as the Docker cgroup driver. The recommended driver is "systemd". Plea
se follow the guide at https://kubernetes.io/docs/setup/cri/
[preflight] Reading configuration from the cluster...
[preflight] FYI: You can look at this config file with 'kubectl -n kube-system get cm kubeadm-config -oyaml'
[kubelet-start] Downloading configuration for the kubelet from the "kubelet-config-1.18" ConfigMap in the kube-system namespace
[kubelet-start] Writing kubelet configuration to file "/var/lib/kubelet/config.yaml"
[kubelet-start] Writing kubelet environment file with flags to file "/var/lib/kubelet/kubeadm-flags.env"
[kubelet-start] Starting the kubelet
[kubelet-start] Waiting for the kubelet to perform the TLS Bootstrap...

This node has joined the cluster:
* Certificate signing request was sent to apiserver and a response was received.
* The Kubelet was informed of the new secure connection details.

Run 'kubectl get nodes' on the control-plane to see this node join the cluster.
```

Check nodes have been added (Run this command on the master node)

```
ubuntu@kubernetes-master:~$ sudo su
root@kubernetes-master:/home/ubuntu# kubectl get nodes
NAME                STATUS   ROLES    AGE   VERSION
ip-10-1-0-12        Ready    <none>   39m   v1.18.1
kubernetes-master   Ready    master   66m   v1.18.1
worker-2            Ready    <none>   31m   v1.18.1
root@kubernetes-master:/home/ubuntu#
```

Step 7 - Test your cluster

kubectl create deployment nginx-deployment —image=nginx

kubectl get deployments

kubectl get pods

```
root@kubernetes-master:/home/ubuntu# kubectl create deployment nginx-deployment --image=nginx
deployment.apps/nginx-deployment created
root@kubernetes-master:/home/ubuntu# kubectl get deployments
NAME               READY   UP-TO-DATE   AVAILABLE   AGE
nginx              1/1     1            1           2m21s
nginx-deployment   1/1     1            1           9s
root@kubernetes-master:/home/ubuntu# kubectl get pods
NAME                               READY   STATUS    RESTARTS   AGE
nginx-deployment-5969c7f455-89zrk  1/1     Running   0          15s
nginx-f89759699-pj65j              1/1     Running   0          2m27s
root@kubernetes-master:/home/ubuntu#
```

Step 8 - Clear the environment

Kubectl delete deployments nginx-deployment
